

# Simplicity and Sustainability thru Innovation

## **PFAS Treatment Ready to go**

Treating water that is contaminated with PFAS compounds does not have to be difficult or expensive. Theia Water offers modular treatment systems which can treat up to 200 gpm of water in a single container. We offer them for drinking water as well as groundwater, wastewater or surface water treatment. Basic Systems include prefiltration, controls, and a manifold to allow for isolation and lead/lag configuration. Systems can be designed to meet the customer's specific needs. These systems are offered for short or long term rental or for purchase and lease to purchase.

Looking to do some pilot testing? We offer pilot test systems that allow you to test multiple medias. Our larger pilot systems can also provide treatment for a significant portion of the flow for many sites. Now you don't have to choose between pilot testing and treating right away. These systems are available at a fraction of the cost building something on site.
